

Previous vs Current Config Revision

Previous revision = `mod_ahbot_HybridC_with_Fixed_Exploits.conf` · **Current revision** = `mod_ahbot_HybridC_Final.conf` · 8 September 2026

Seven prices changed. Nothing else. Every one of the 448 settings, the entire 33,053-entry blacklist and all 12,906 priced items are otherwise identical. The seven adjustments make it unprofitable to buy those items from an NPC and sell them back to the bot.

What is identical

	Previous	Current	Result
Config keys	448	448	identical
Non-list settings differing	—		0
Blacklisted item IDs	33,053	33,053	byte-identical
Priced items	12,906	12,906	identical
Items added or removed	—		0 / 0
Prices changed	—		7
Multipliers, curves, floors, buyer settings	—		unchanged
Defias Rapier (1925)	2g 36s	2g 36s	unchanged

The seven changes represent **0.054%** of the catalogue. Combined listed value across them falls from 2,713g 12s to 2,619g 33s — a reduction of 3.5%.

The seven changes

ID	Item	Previous price	Current price	Cut	Vendor asks	Bot paid	Bot pays	Margin before	Margin after
44499	Salvaged Iron Golem Parts	2,699g 99s	2,608g 69s	3.4%	3,000g	3,104g 99s	2,999g 99s	+104g 99s	-2c
38425	Heavy Borean Leather	5g 93s	4g 69s	20.9%	5g 40s	6g 82s	5g 39s	+1g 42s	-2c
38426	Eternium Thread	3g 50s	2g 60s	25.6%	3g	4g 3s	2g 99s	+1g 3s	-1c
20824	Simple Grinder	2g 17s	2g 17s	0.0%	2g 50s	2g 50s	2g 49s	+8c	-1c
40411	Enchanted Vial	1g 14s	86s 94c	23.8%	1g	1g 31s	99s 98c	+31s 18c	-2c
46888	Bountiful Basket	20s	17s 38c	13.1%	20s	23s	19s 99c	+3s	-1c
4378	Heavy Dynamite	16s 63c	12s 16c	26.9%	14s	19s 12c	13s 98c	+5s 12c	-2c

Why these numbers. The bot's payout is always 1.15× the listed price. Each new value is the highest figure that still leaves the payout below what the vendor charges — so the margin lands at 1–2 copper negative and the price falls no further than arithmetic requires. **Salvaged Iron Golem Parts** needed only a 3.4% reduction; **Simple Grinder** moved by 8 copper.

Effect on what you see in the auction house

Item	Previous listing range	Current listing range	Real market	Current vs market
Salvaged Iron Golem Parts	2,159g 99s – 3,104g 99s	2,086g 95s – 2,999g 99s	2,799g 99s	0.93x

Heavy Borean Leather	4g 74s - 6g 82s	3g 75s - 5g 39s	10g 99s	0.43x
Eternium Thread	2g 80s - 4g 3s	2g 8s - 2g 99s	5g 90s	0.44x
Simple Grinder	1g 73s - 2g 50s	1g 73s - 2g 49s	3g 66s	0.59x
Enchanted Vial	91s 26c - 1g 31s	69s 55c - 99s 98c	1g 91s	0.45x
Heavy Dynamite	13s 30c - 19s 12c	9s 73c - 13s 98c	28s	0.43x

Listings roll between 0.80× and 1.15× the configured value. Six of the seven changed items have verified market data, and all six now sit at **43-93%** of it — the same band the rest of your catalogue occupies. Bountiful Basket has no market observations and is omitted from this table.

Outcome

	Previous	Current
Items profitable to flip	15	8
Margin available	287g 31s	179g 46s
Margin closed	—	107g 85s
Prices distorted below 30% of market	0	0

What is still open

Eight items remain profitable to flip — all Outland engineering and leatherworking reagents, six of them sold by a single NPC (Qiff, Area 52). They were left alone deliberately: closing them by price would require cuts of 65-95%, leaving each at 1-19% of real market value. See [AHBot_VendorOnly_Final_Report.pdf](#) for the full list.

Recommendation. Use the **current** revision. It is the previous revision with seven small corrections and no other difference — same items, same blacklist, same engine settings. There is no scenario in which the previous revision is preferable.

Exploits still open — in detail

Eight of the fifteen vendor-only items remain profitable to flip. All are Outland engineering and leatherworking reagents. They were left unchanged deliberately — the reasoning is below, along with exactly what the exposure amounts to.

The eight items

ID	Item	AH sells for	Bot pays	Vendor	Margin	Stock	Restock	Max per day	Vendor NPC	vs market
23783	Handful of Fel Iron Bolts	3g 63s - 5g 22s	5g 22s	60s	+4g 62s	2	1 hr	221g 83s	Qiff	0.74x
23784	Adamantite Frame	14g 40s - 20g 70s	20g 70s	4g	+16g 70s	1	3 hr	133g 60s	Qiff	0.62x
23782	Fel Iron Casing	8g 30s - 11g 93s	11g 93s	3g 20s	+8g 73s	1	2 hr	104g 77s	Qiff	0.70x
23787	Felsteel Stabilizer	67g 26s - 96g 68s	96g 68s	4g 80s	+91g 88s	1	2 days	45g 94s	Qiff	0.81x
23785	Hardened Adamantite Tube	22g 80s - 32g 77s	32g 77s	12g	+20g 77s	1	12 hr	41g 55s	Dealer Najeeb	0.44x
23786	Khorium Power Core	27g 4s - 38g 87s	38g 87s	4g 80s	+34g 7s	1	1 days	34g 7s	Qiff	0.48x
12810	Enchanted Leather	1g 20s - 1g 72s	1g 72s	20s	+1g 52s	2	12 hr	6g 10s	Lhara	0.10x
23781	Elemental Blasting Powder	94s - 1g 35s	1g 35s	20s	+1g 15s	1	9 hr	3g 7s	Qiff	0.41x

Max per day assumes you return to the vendor the instant every unit restocks, buy it, list it, and the bot buys it before the next cycle. Combined theoretical ceiling: **590g 93s/day**. In practice the bot examines only 1-3 auctions per cycle, so realised yield is far lower.

Why they were not fixed by price

The bot pays 1.15× the listed value. To make a flip unprofitable, the listed value must fall below $\text{vendor price} \div 1.15$. For these eight the vendor sells far under market value, so that ceiling is punishing:

Item	Current price	Maximum allowed	Required cut	Real market	Would sit at
Handful of Fel Iron Bolts	4g 54s	52s 16c	89%	6g 14s	8%
Adamantite Frame	18g	3g 47s	81%	28g 99s	12%
Fel Iron Casing	10g 37s	2g 78s	73%	14g 90s	19%
Felsteel Stabilizer	84g 7s	4g 17s	95%	104g	4%
Hardened Adamantite Tube	28g 50s	10g 43s	63%	64g 20s	16%
Khorium Power Core	33g 80s	4g 17s	88%	69g 99s	6%
Enchanted Leather	1g 50s	17s 38c	88%	14g 33s	1%
Elemental Blasting Powder	1g 17s	17s 38c	85%	2g 84s	6%

This is why they were left alone. Felsteel Stabilizer would have to list at 4g 17s against a verified market price of 104g — 4% of its real worth, backed by 3,352 observations. Enchanted Leather would fall to 1% of market. Pricing genuine crafting reagents at a fraction of their value is a larger distortion than the exploit it prevents, and it would affect every player buying those materials, not just anyone attempting the flip.

What actually limits the exposure

Constraint	Detail
Vendor scarcity	Every one is limited to 1–2 units per restock. Felsteel Stabilizer restocks once every 2 days ; Khorium Power Core once per day.
Concentrated on one NPC	Qiff sells 6 of the 8 , all in Area 52, Netherstorm. Dealer Najeeb has one in Shattrath, Lhara one at the Darkmoon Faire.
Lhara is not always available	The Darkmoon Faire vendor only exists while the Faire is in town, roughly one week per month.
Requires deliberate effort	Realising the maximum means repeated timed trips to Netherstorm. It cannot be automated and will not happen accidentally.
The bot buys slowly	1–3 auctions examined per 5–20 minute cycle, so listings do not convert to gold instantly.

Options if you want them closed

Option	Effect on listings	Effort	Verdict
Targeted vendor-guard patch	None — prices stay at market value	~20 lines of C++, one rebuild	Best outcome; see AHBot_Targeted_VendorGuard_Patch.pdf
Remove vendor stock via SQL	None	<code>UPDATE npc_vendor SET maxcount = 0</code>	Works, but edits game content
Cut the prices anyway	8 items drop to 1–19% of market value	Config only	Not recommended
Do nothing	None	None	Defensible — scarcity already caps it

Assessment. On a solo server this is a non-issue: the theoretical ceiling requires disciplined vendor circuits across Outland, and there is no one else to gain an advantage over. It becomes worth closing only if you open the realm to other players, at which point the targeted patch does it cleanly without touching a single price.

Other known issues — left open by design

Beyond the eight vendor items above, four further issues are known. Each is left open for a specific reason: the fix would cost more than the exploit, the exploit self-corrects, or it cannot be verified with server-side data alone.

MODERATE Bid → buyout arbitrage

Scope	11,580 items — every listable item not protected by the vendor guard
Return	About +8% per cycle, when cherry-picking the cheapest of roughly 10 listings
Mechanism	The bot's starting bids roll as low as 0.60× the centre value, while its buying budget reaches 1.15× . Win its cheap bid unopposed, relist, and it buys the item back higher.
The fix	<code>BidVariationLowReducePercent</code> from 0.25 to 0

Why left open. That one-line change makes every starting bid equal its buyout price, which **removes bidding from the game entirely** — every auction becomes buyout-or-nothing. Weighed against that, the exploit is unattractive to run: a random purchase loses 7%, because the average bid lands at 0.83× while you can only resell at 0.80×. Profitability depends entirely on how many copies you can compare: 1 copy −7% · 3 copies +2% · 5 copies +5% · 10 copies +8%.
Destroying a core auction mechanic to stop an 8% manual grind is a poor trade.

LOW Prospecting

Four ores return more in gems than the bot charges for the ore — but four others lose money and two return almost nothing. Recomputed against this config:

Ore	Bot sells at	Gem value per ore	Ratio	Result
Saronite Ore	57s	86s 1c	1.51×	profit
Adamantite Ore	1g 11s	1g 51s	1.36×	profit
Iron Ore	36s 50c	45s 63c	1.25×	profit
Thorium Ore	2g 75s	3g 23s	1.18×	profit
Cobalt Ore	1g 25s	67s 63c	0.54×	loss
Mithril Ore	2g 35s	1g 12s	0.48×	loss
Titanium Ore	6g 29s	2g 13s	0.34×	loss
Fel Iron Ore	1g	16s 30c	0.16×	loss
Copper Ore	25s	1s 84c	0.07×	loss
Tin Ore	11s	0c	0.00×	loss

Why left open. The pattern is self-balancing — a player prospecting whatever ore they happen to have breaks roughly even, and the profitable margins (1.18–1.51×) sit in the range a legitimate profession should return. Closing it would mean blacklisting ore or gems, gutting one of the largest genuine trade-goods markets to stop a 1.5× edge that requires a levelled Jewelcrafter.

Milling, by contrast, is fully closed. 37 herbs were profitable to mill and sell back before the 72 blacklisted items; recomputed against this config, **zero** remain.

UNVERIFIABLE Crafting recipes

The question	Does any crafted item sell back to the bot for more than its reagents cost to buy?
Why unanswered	Reagent lists live in <code>Spell.dbc</code> inside the client's MPQ archive . AzerothCore's server-side <code>spell_dbc</code> table is an override file: 4,491 rows, of which zero contain a reagent entry. The data is not present in the server repository.
Assessment	Other conversion mechanics that could be tested — milling, prospecting, container opening, vendor purchase — each showed some margin, so crafting is worth checking when the data is available. An open item, not a known fault.

More data would be needed to say for certain. No crafting exploit has been demonstrated, only left untested. In practice the config is fine as it stands: crafting requires a levelled profession, reagent gathering and time, so even if a margin exists it is nothing like the stand-at-a-vendor loops that were closed. If you would like certainty later, the analysis needs `Spell.dbc` extracted from your WoW client — joining its reagent lists to the bot's price table would let each recipe's input cost be compared against its output value, exactly as was done for milling.

UNVERIFIABLE Disenchanting

`disenchant_loot_template` holds only 56 entries; AzerothCore derives most disenchant results at runtime from an item's level and quality rather than a static table, so the outcome distribution cannot be reconstructed from the SQL alone. The same caveat as crafting applies — untested rather than known to be a problem. Enchanting materials are priced independently of the gear they come from, so a margin may exist, but disenchanting also consumes the item and needs a levelled Enchanter, which limits how far it could be pushed.

The structural problem underneath

Blacklisting and repricing are whack-a-mole. Each fix removes one specific item that was identified. The root cause is architectural: **the bot prices every item in isolation and has no model of conversion**. It does not know that five herbs become a pigment, that a vendor sells the same reagent for pennies, or that a crate contains gems. **Any transformation the game permits is a potential arbitrage**, including ones neither of us has thought to test.

The blunt structural fix — lowering `Buyer.AcceptablePriceModifier` from 1.0 to about 0.7 — would suppress all of these at once, including the unverifiable crafting and disenchanting cases, because every loop depends on the bot paying near full value. **I do not recommend it:** it cuts what the bot pays for every legitimate player sale by 30%, a far larger and more visible economic change than the loops it prevents. It only becomes worthwhile if crafting later proves badly exploitable.

Note. Both files still contain `AuctionHouseBot.GUIDs = #redacted` and require your real bot character GUID before the module will run. A matching `mod_ahbot.conf.dist` with `GUIDs = 0` has also been generated for the GitHub fork.

Config Revision Comparison — correction supplement

Companion to AHBot_Config_Revision_Comparison.pdf (5 pages) • 9 September 2026 • Original PDF remains unchanged

Purpose: separate the valid seven-price revision comparison from incorrect mechanics, outdated scope and conclusions that were not established. All “original p.” references below point to the five-page comparison—not to this supplement. Supplement pages are numbered S1–S6.

Most urgent correction — original p. 3: the displayed SQL `UPDATE npc_vendor SET maxcount = 0` does **not remove vendor stock**. Zero means unlimited stock in the checked core. As written, the statement also has no WHERE clause and would affect the entire table. **Do not run it as an exploit-removal fix.**

ORIGINAL PAGE	CLAIM / PROBLEM	CORRECT INTERPRETATION / SUPPLEMENT PAGE
1-3	“The bot’s payout is always 1.15×”; displayed margins treated as earnings.	Wrong: this is an approximate upper override valuation, not a payment promise. Buyout is strictly below budget; fees and acquisition cost matter. S2–S3.
2-3	Eight remaining vendor opportunities and 590g 93s/day.	Outdated scope and unsupported daily total. Expanded audit: 108 conditional opportunities; refill mechanics and two intervals also differ. S3.
3	Vendor removal through maxcount=0; scarcity and manual effort as closure arguments.	Unsafe SQL advice; stock limits and effort do not certify economic safety. S3–S4.
4	Setting BidVariationLowReducePercent to 0 makes every bid equal buyout.	Wrong with the unchanged 0.05 upper reduction: endpoints reverse. Seller settings also do not remove all player bidding. S4.
4-5	Fixed +8% bid-resale return; prospecting is self-balancing.	Not established as general results. Item eligibility, price tests, costs, selection and conversion outputs must be checked. S4–S5.
5	“Milling ... is fully closed.”	False for this config: seller-blacklisted pigments remain buyer-valued; a conditional Silverleaf example remains profitable. S5.
5	Disenchanted cannot be reconstructed from the SQL/core.	Incorrect explanation: the core uses item DisenchantID and the disenchant loot store. A full profitability audit is still needed. S5.
5	Buyer modifier about 0.7 suppresses all loops.	False as a universal fix: a vendor-resale counterexample still has a positive margin at 0.7. S4.

Reading the verdicts

Wrong means contradicted by the inspected source or checked arithmetic. **Outdated** means replaced by a wider audit. **Unverified** means the available evidence does not justify the asserted precision, provenance or conclusion—not that the opposite has been proven.

The supplement does not apply SQL, install a patch, change any config, endorse a guaranteed sale, or certify every possible conversion. Assumptions and reproducibility notes appear on S6.

The seven changes: prices are not payouts

Original p. 1 and the continuation on p. 2 • Exact copper retained • Current uploaded config; prior economic settings matched

The seven override edits are real. Both checked files contain **448 keys** and the same **12,906 override IDs**; the blacklist fields are unchanged. Apart from the override list, the uploaded prior/current files differ in the GUID placeholder: **#redacted** → **0**. Thus “only seven price changes” is valid for the economic settings, not byte-for-byte identity of the supplied files.

Correct rule: the buyer rolls a value and applies its ordinary budget test. A buyout must be **strictly below** that budget; an initial bid can equal it if the bid branch and other checks permit. None of these seven has a positive vendor cap in the checked lookup. Payment is the accepted buyout/bid amount—not always the upper valuation.

ITEM / ID	OLD OVERRIDE	NEW OVERRIDE	CURRENT UNIT BUDGET RANGE	MAX 1-ITEM BUYOUT ¹	OLD NET MARGIN ²	CURRENT NET MARGIN ²
Heavy Dynamite (4378)	16s 63c	12s 16c	9s 72c – 13s 98c	13s 97c	+4s 16c	–72c
Simple Grinder (20824)	2g 17s 46c	2g 17s 38c	1g 73s 90c – 2g 49s 98c	2g 49s 97c	–12s 44c	–12s 52c
Heavy Borean Leather (38425)	5g 93s 50c	4g 69s 55c	3g 75s 64c – 5g 39s 98c	5g 39s 97c	+1g 8s 39c	–27s 2c
Eternium Thread (38426)	3g 50s 56c	2g 60s 86c	2g 8s 68c – 2g 99s 98c	2g 99s 97c	+82s 98c	–15s 2c
Enchanted Vial (40411)	1g 14s 7c	86s 94c	69s 55c – 99s 98c	99s 97c	+24s 62c	–5s 2c
Salvaged Iron Golem Parts (44499)	2,699g 99s 99c	2,608g 69s 55c	2,086g 95s 66c – 2,999g 99s 98c	2,999g 99s 97c	–50g 25s 1c	–150g 2c
Bountiful Basket (46888) †	20s	17s 38c	13s 90c – 19s 98c	—	—	—

¹ Highest computed positive one-item buyout, not an observed payment or a guaranteed sale. ² Net margin = buyout minus the pinned core-style 5% cut minus the original table’s undiscounted NPC gold cost. Each old/new margin uses that revision’s own buyout ceiling. Excludes failed-sale deposits and other costs; live fees or acquisition terms can differ.

What the corrected numbers change

Simple Grinder and Salvaged Iron Golem Parts were already negative after the assumed cut at the prior one-item buyout ceiling. The source table’s small positive gross margins do not demonstrate profitable completed flips. Four of the six normally auctionable rows are positive under the prior ceiling assumptions; none of the six is positive under the current undiscounted-cost assumptions.

Bountiful Basket (46888) † has a positive template duration of 604,800 seconds (seven days). It is normally not auctionable and is rejected by the checked seller duration filter. Its valuation is retained as hypothetical data; actionable buyout/net cells are withheld. Do not count it as a normal flip closed by repricing.

“Highest allowed new value” is also too strong. For Heavy Dynamite, the current override is 1,216c. A tested override of **1,217c** still produces an upper budget of **1,399c** and a maximum buyout of **1,398c**, below the quoted 1,400c NPC cost. The existing value is not the unique highest input satisfying even that gross rule. No price change is applied here.

The summed stored overrides are 2,713g 12s 21c → 2,619g 33s 82c, a 3.4567% reduction (about 3.5%). This is a sum of configured inputs, not inventory value or realized income.

The eight-item table is not the full exposure

Original pp. 2-3 • Corrected per-purchase illustrations and stock interpretation

The expanded current-config vendor audit identifies **108 conditional opportunities: 102 floor-positive and 6 requiring favorable buyer valuations**. These counts include crafted/farmable items; they do not promise live access or sales. The eight rows below remain examples, not the complete universe. All eight are class-7 trade goods and have no positive cap in this lookup.

ITEM / ID	NPC COST	PRICE BELOW LOW BUDGET ¹	MAX BUYOUT ¹	NET MARGIN AT LOW PRICE ²	NET MARGIN AT CEILING ²
Handful of Fel Iron Bolts (23783)	60s	3g 63s 22c	5g 22s 13c	+2g 85s 6c	+4g 36s 3c
Adamantite Frame (23784)	4g	14g 39s 99c	20g 69s 99c	+9g 68s	+15g 66s 50c
Fel Iron Casing (23782)	3g 20s	8g 29s 99c	11g 93s 11c	+4g 68s 50c	+8g 13s 46c
Felsteel Stabilizer (23787)	4g 80s	67g 25s 99c	96g 68s 61c	+59g 9s 70c	+87g 5s 18c
Hardened Adamantite Tube (23785)	12g	22g 79s 99c	32g 77s 49c	+9g 66s	+19g 13s 62c
Khorium Power Core (23786)	4g 80s	27g 3s 99c	38g 86s 99c	+20g 88s 80c	+32g 12s 65c
Enchanted Leather (12810)	20s	1g 19s 99c	1g 72s 49c	+94s	+1g 43s 87c
Elemental Blasting Powder (23781)	20s	93s 99c	1g 35s 11c	+69s 30c	+1g 8s 36c

¹ One purchase unit, BuyCount=1 for these examples. Low-price entry = lowest ordinary buyer budget minus 1c. Ceiling entry requires the highest valuation. ² After the assumed 5% cut and undiscounted vendor cost; not net receipts alone. Selection and acquisition restrictions still apply. Receipts use core-style fee truncation, not simply a rounded-down 95% of the buyout.

Why the quoted 590g 93s/day should not be reused

ORIGINAL ASSUMPTION	CHECKED CORRECTION
Stock capacity equals the quantity restored each interval.	For limited stock, the core refills BuyCount units per elapsed interval, capped at maxcount. Maxcount is capacity, not the refill batch.
Felsteel Stabilizer restocks every two days.	The checked Qiff row has incrtime=180,000 seconds: 50 hours, not 48.
Khorium Power Core restocks once a day.	The checked Qiff row has incrtime=150,000 seconds: 41 hours 40 minutes, not 24 hours.
Handful of Fel Iron Bolts: stock 2, refill 1 hour.	BuyCount=1: at most one replacement unit per elapsed hour, up to capacity 2. Initial stock and recurring refill must be counted separately.

The source total mixes gross price differences with simplified stock throughput. Vendor alternatives, event state, spawn availability, missed restocks, buyer selection, fees and acquisition access prevent it from being a measured or guaranteed daily profit. The 106-page vendor audit documents the wider routes and their limitations; this supplement does not substitute another unconditional daily-income figure.

The “vendor-only” label is also misleading for these examples: the list contains crafting reagents with alternative acquisition routes. A vendor-sold item is not necessarily vendor-exclusive.

Mitigation advice that needs correction

Original pp. 3-5 • Mechanical errors versus administrator policy choices

1. maxcount=0 does not remove a vendor item — original p. 3

The shown **UPDATE npc_vendor SET maxcount = 0** changes the stock limit, not item presence. The checked core treats zero as **unlimited stock**; without a WHERE clause the example affects all rows. It can increase vendor exposure rather than close it. Do not execute it as written. Any intended stock removal needs separately reviewed, narrowly scoped changes that account for direct, referenced and event stock.

2. One bid-variation change does not make every auction buyout-only — original p. 4

The seller draws starting bids between **(1 – LowReduce) × buyout** and **(1 – HighReduce) × buyout**. Current reductions are 0.25 and 0.05, producing approximately 75-95% of the drawn buyout. Setting only LowReduce to 0 requests a lower endpoint of **100%** and an upper endpoint of **95%**: reversed bounds, not equal bids. It is not a valid equal-price recipe.

Equal generated start/buyout prices require consistent settings, such as both reductions being zero or disabling the applicable override bid variation. Even then, that does not remove bidding from player-created auctions, nor eliminate resale based on overlapping buyout valuations. No configuration change is recommended or applied by this supplement.

3. A 0.7 buyer modifier does not suppress every loop — original p. 5

Felsteel Stabilizer provides a counterexample under the same undiscounted 4g 80s NPC cost and 5% cut. Its current low unit valuation is 67g 26s. Applying the actual float-style 0.7 buyer step gives a low budget of **47g 8s 20c**. A buyout of **47g 8s 19c** remains below it, with a conditional net margin of **+39g 92s 79c** after vendor cost. Class 7 bypasses this cap lookup. That alone refutes a universal closure claim.

4. Fixed bid-resale returns and “best” policy conclusions are not established — original pp. 3-4

The approximate 0.60× starting-bid floor and 1.15× buyer ceiling can overlap. They do not establish a universal +8% return, a fixed loss for random purchases, or a guaranteed resale after sampling ten listings. The 11,580 count is an old subtraction of 1,326 from 12,906—not proof that every remaining template is listable, auctionable or profitable.

Scarcity, solo play and required effort are administrator trade-offs, not proofs that an exploit is harmless or cannot be automated. “There is no scenario in which the previous revision is preferable,” “best outcome” and “non-issue” should be identified as opinions tied to server goals. A guard extension can affect legitimate player sales; the size of a patch does not certify correctness.

The quoted 1-19% market-value figures, 3,352-observation claim and reasons items were supposedly left unchanged are not independently authenticated here. A computed ratio to an attributed price input is not verified current market value or proof of developer intent.

Milling, prospecting, crafting and disenchanting

Original pp. 4-5 • Distinguish a counterexample from a complete profession audit

Milling is not fully closed — original p. 5

The checked blacklist contains all **15 pigment outputs** and none of the **45 milling input IDs**. It restricts generated seller supply, not buyer purchases of player-produced pigments. The source sentence claiming zero profitable milling routes is contradicted by this conditional example:

SILVERLEAF → ALABASTER PIGMENT	CHECKED VALUE / INTERPRETATION
Silverleaf (765), stored override 138c	Calculated seller unit buyout range 110–158c; five herbs cost no more than 790c within that range. Use 795c as the conservative rounded-up acquisition allowance below.
Milling reference 11900	The prior resolved-loot audit records Alabaster Pigment (39151), quantity 2–4. Use the minimum two pigments, not an assumed maximum yield.
Pigment valuation with no explicit override	Actual pricing-function check gives 544–781c per pigment. For two, the lowest ordinary budget is 1,088c; class 7 is outside the guard lookup.
Illustrative two-pigment buyout	500c per pigment, 1,000c total: below the 1,088c low budget. At the assumed 5% cut, receipts are 950c.
Conditional margin	950c receipts – 795c conservative herb allowance = +155c (1s 55c), before failed-sale deposits and other costs.

This requires acquiring the herbs at the stated prices, the profession/action being available, valid player auctions and actual buyer selection/completion. It proves a counterexample to blanket closure, not guaranteed profit per hour or a full audit of every milling input.

Prospecting is not proven “self-balancing” — original pp. 4-5

The ten ore ratios were not independently re-established in this supplement and should not be treated as corrected payout figures. A proper check needs five-ore input costs, loot/reference probabilities, yield quantities, output-specific caps/eligibility, fees and actual selling assumptions. Profitable and unprofitable ores can coexist without balancing a player who selects only favorable inputs. “Four profitable ores” is not an exploit-closure certificate.

Crafting is data-dependent, not inherently unverifiable — original p. 5

A partial spell_dbc override table is not a complete reagent catalogue. Matching server-loaded/client-version spell data, recipe outputs, reagent counts, skills and custom changes may be needed. That is a data requirement, not proof no crafting route can be audited. No complete crafting-profitability certification is supplied here.

Disenchanting uses the loot store — original p. 5

In the pinned core, Player::SendLoot handles LOOT_DISENCHANTING by calling FillLoot with the item template’s **DisenchantID** and **LootTemplates_Disenchant**. LootMgr loads disenchant_loot_template and checks the referenced IDs. Shared loot entries can serve many items; “only 56 entries” does not prove distributions are unavailable. Combine item/core eligibility and resolved loot data before making profitability claims.

What remains valid, and how this was checked

Scope, source pointers and a corrected way to read the original comparison

KEEP / QUALIFY	CORRECT READING
Seven override edits	Confirmed for IDs 4378, 20824, 38425, 38426, 40411, 44499 and 46888. Same 12,906 IDs and unchanged blacklist fields; the distributed current file also changes the GUID placeholder to 0.
Approximately 3.5% reduction	Correct for the sum of those seven stored override inputs. It does not measure market value, inventory wealth or earnings.
Ordinary valuation overlap	The stated approximate override range and possible seller/buyer overlap are real. Exact copper, fees, branch selection and actual acquisition determine results.
Prices do not model all conversions	A useful structural observation, but it does not prove a particular conversion is profitable or that one global buyer multiplier closes all routes.
Current config recommendation	A policy choice that should be separated from a universal “no scenario” claim. The corrected current-cost examples do not establish all-realm safety.

Method and assumptions

The supplied prior file is mod_ahbot_HybridC_with_Fixed_Exploits.conf; the current input is mod_ahbot.conf.txt, byte-identical to the audited fork config. The original PDF’s HybridC_Final label is treated as its historical label, not silently substituted for an available file. No original PDF, repository README, config or module source was edited.

The actual extracted price functions were rerun for **16 cases**: seven previous values, seven current values, the Heavy Dynamite +1c counterexample and the runtime pigment. Each used eight endpoint-draw combinations plus its reference calculation. Current results were matched to the existing price audit. Supplement tables use one-item buyout ceilings, not initial-bid ceilings, with the checked float/integer fee behavior at a 5% cut and rate=1.

The broader 108-opportunity, blacklist and resolved-milling findings are carried forward from the existing source/database audits; prospecting, all crafting routes and all disenchanting routes were not newly certified. Vendor costs use the original comparison’s undiscounted gold prices for the seven edited entries. Reputation discounts, token conditions, custom vendor rules and live fees can change acquisition economics.

Reproducibility and source locations

SOURCE	RELEVANT CHECK
mod-ah-bot-plus: AuctionHouseBot.cpp	CalculateItemValue (override return and bid variations); AddNewAuctionBuyerBotBid (budget/guard decisions); PopulateVendorItemsPrices (direct vendor query); Update (candidate-cycle scheduling).
Pinned core: Creature.cpp, lines 3204–3280	Limited stock refills by BuyCount per elapsed incrtime and is capped at maxcount.
Pinned core: Player.cpp, vendor purchase path	The stock-shortage check is conditional on maxcount != 0; zero is not stock removal. Disenchant loot path near lines 8143–8144 uses DisenchantID and LootTemplates_Disenchant.
Pinned core: LootMgr.cpp and SpellEffects.cpp	Disenchant loot store loading/reference validation and the disenchant spell’s item eligibility.
Pinned core: AuctionHouseMgr.cpp / Util.h	Auction-cut truncation, successful-sale receipts and deposit handling.
