

Rolled Valuation Explained

Rakzur Club pricing guide • Item 12983 • Checked config: mod_ahbot.conf.txt

In plain English: when the buyer evaluates an eligible auction, it randomly chooses a value for the item within the configured range. Think of this as its buying budget for that evaluation—not a fixed offer, market price or guaranteed payment.

1. The override is the starting point

The config entry **12983:37195** means item 12983 has a stored override of **37,195 copper = 3g 71s 95c**. It does not mean the bot always buys or sells it for exactly that amount. One gold is 10,000 copper; one silver is 100 copper.

VALUE FOR RAKZUR CLUB	AMOUNT
Stored override / centre	3g 71s 95c
Lowest calculated buyer unit value	2g 97s 56c
Highest calculated buyer unit value	4g 27s 74c
Positive vendor cap in the checked lookup	None

Your config applies approximately **−20% / +15%** buyout variation to this override. The endpoints come from $\text{override} \times 0.80$ and $\text{override} \times 1.15$, with the code’s floating-point and integer handling. The buyer modifier is **1.0**. For this item, the resulting budget is an integer from **29,756 to 42,774 copper**.

2. The roll is a budget, not the price paid

For a positive buyout, the rule is **your buyout must be strictly lower than the buyer’s rolled budget**. If the buyout is accepted, the bot pays your posted buyout—not the rolled budget. The following are illustrative buyer rolls for a club listed at 3g 55s:

BUYER ROLLS	YOUR BUYOUT	BUYOUT TEST
3g 20s	3g 55s	Fails: your price is higher.
3g 55s	3g 55s	Fails: equality is not enough.
3g 80s	3g 55s	Passes: the buyout payment would be 3g 55s.

A failed buyout test may lead to a bid if your starting/current bid and the other rules permit it. A later eligible evaluation can produce a different roll; the module does not lock the first valuation for all future attempts.

Seller and buyer rolls are separate. A seller listing at 3g 55s does not tell you the buyer’s next budget. Even the cheapest of ten visible listings need not be the true minimum.

How high can you price it?

One Rakzur Club • Current checked config • Whole-auction buyout amounts

To remove random-budget rejection for this item: set the one-item buyout to **2g 97s 55c**—one copper below the lowest budget. You may set the starting bid to that same amount to avoid accepting a lower initial bid. This does not guarantee selection or a sale before expiry.

Higher prices can work, but fewer rolls permit them

YOUR BUYOUT	MINIMUM ROLL NEEDED	PRICE TEST PASSES ¹
2g 97s 55c	Every roll in the range	100.00%
2g 97s 56c	2g 97s 57c	99.99%
3g	3g 1c	98.12%
3g 55s	3g 55s 1c	55.87%
4g	4g 1c	21.31%
4g 27s 73c	4g 27s 74c	0.0077% (1 in 13,019)
4g 27s 74c	Above the available range	0.00%
6g	Above the available range	0.00%

¹ Conditional on the auction being selected and otherwise eligible, with this item’s uncapped, uniform integer budget draw. This is the probability of passing the ordinary buyout price test on one evaluation—not the chance of selling before expiry. Percentages are rounded.

How the calculation works

There are **13,019 possible integer budgets**: $42,774 - 29,756 + 1$. Count the budgets strictly above your buyout, then divide by 13,019. At **3g 55s**, the passing budgets are 35,501–42,774: **7,274 of 13,019**, or approximately **55.87%**.
At **4g**, about **21.31%** of those draws pass. At **4g 27s 73c**, only the highest draw passes. A buyout of **4g 27s 74c or more** cannot pass the buyout test under these settings. A separate bid can have a different boundary.

Why a sale at 3g 55s is entirely possible

If the bot listed the club at 3g 55s: that is within its seller valuation range. **If the bot bought your club at a 3g 55s buyout:** its buyer roll exceeded that amount. Neither event means the centre or range changed.
If 3g 55s was the amount seen in mail: distinguish the auction price from the receipt. At the assumed 5% cut and rate=1, a 3g 55s gross sale nets **3g 37s 25c**, excluding returned deposit principal. Mail can also return that deposit. To explain a 3g 55s receipt, check the actual winning price, deposit and house fee settings.

Practical checks before you post

A permitted price is only one part of a successful sale

Why 6g failed—and why 3g may remain unsold

6g exceeds the 4g 27s 74c upper budget, so that buyout cannot pass under these settings. **3g is just above the minimum**: its price test passes on approximately **98.12%** of eligible evaluations. Therefore, a prolonged lack of purchase at 3g should prompt checks beyond price rather than assuming every roll was too low.

CHECK	WHAT TO CONFIRM
Correct loaded config	The server is actually using 12983:37195, override pricing and its buyout variations are enabled, and the buyer modifier is 1.0. A file on disk is not proof its values were loaded.
Buyer is running	Buyer.Enabled is true and valid bot character GUIDs are configured. The distributed GUIDs=0 placeholder must be replaced by the administrator.
Your auction can enter the candidate pool	Its owner is not a configured bot and its current bidder is not a configured bot. While a bot remains the current bidder, the query excludes it from further buyer consideration.
Selection and house match	The buyer must select the auction and resolve it in the applicable auction-house pass. A lower price does not increase its priority in the random selection.
Valid auction and tradable item	The auction must still exist with a valid item object, positive count and valid template. Normal posting restrictions, including soulbinding or other trade restrictions, still matter.
Bid and buyout are intentional	A low starting bid can be accepted instead of your desired buyout when the bid branch is reached. Set a starting bid you are willing to accept.

If the PDF says a centre of 7g 99s

That does **not** match the quoted override. The checked centre for Rakzur Club is **3g 71s 95c**. Verify the item ID, PDF edition and config actually loaded by the server. An outdated or mismatched document is one possibility; do not apply extra formula multipliers to this explicit override to reconcile the difference.

Do not apply this exact range to every item

For another item, use its own verified buyer range. Formula-priced items can have additional effects and rerolls. A positive vendor cap can override a much larger ordinary budget, and it applies to the **whole auction**, not each stacked unit. Rakzur Club has max stack 1 and no positive cap in the checked lookup.

Bottom line: 2g 97s 55c passes Rakzur Club's price test across the checked valuations. Higher prices trade a higher possible payment for fewer acceptable draws. No price guarantees when the auction is selected, and there is no hidden add-on approval or market-demand score in the inspected buyer routine.

Basis: current uploaded config and the previously rechecked CalculatItemValue / AddNewAuctionBuyerBotBid source. Price record: item 12983 in the corrected Complete Item Price List (page 133). Core/world baseline 16685343110115b12e76d517f7bac15c6a97fb2a. No config/source changes were made. The guide describes the checked module, not a live-server or add-on-compatibility certification.
