

Rolled Valuation: Item Stacks

How the bot decides whether to buy a player auction • Companion to the Rakzur Club guide

In plain English: the bot rolls one value per item, then multiplies that value by the number of items in your auction. Your **total stack buyout** must be lower than that budget. Any positive vendor cap is checked separately—and does **not** grow with the stack.

Four pricing categories, the same stack rule

LABEL	WHAT IT MEANS HERE	WORKED STACK
S	Inherited scrape-derived override. Warmane / Lordaeron attribution is statistical, not confirmed collection metadata.	20 Linen Cloth • p.2
W	Imported/calibrated override attributed to Warmane / Lordaeron data. The full provenance chain is not independently authenticated.	1,000 Thorium Headed Arrows • p.3
P	Formula-estimated amount saved as an explicit override—not recalculated from the formula each time.	20 Primal Water • p.4
A	Adjusted explicit override. This label alone does not prove a vendor-resale issue is closed.	20 Heavy Borean Leather • p.5

Read every listed buyout as a whole-auction total

With your checked buyer modifier of **1.0**, a roll of 80 copper per Linen Cloth gives a budget of **80 × 20 = 1,600 copper = 16s**. A 15s stack buyout passes; 16s does not pass the buyout test. If accepted, the bot pays your posted 15s—not its 16s budget.

One roll, then multiplication: it does not make 20 independent rolls or add 20 different valuations. Possible budgets for a stack of 20 therefore advance in 20-copper steps. Buying and selling valuations are separate rolls.

What else is covered: a capped potion on p.6; ore, bars, stone, herbs, dust, gems, motes and leather on p.7; food, elixirs, flasks, potions, explosives, vials, glyphs and fish on p.8; posting checks on p.9. These are representative stackable types, not every item class or every item.

All 21 examples use the same uploaded mod_ahbot.conf.txt and pinned data/source as the previous guide. All are stored overrides; the separate runtime-fallback category is not covered. Values are gross auction amounts, before fees. No price guarantees selection, a purchase or sale before expiry.

S — Linen Cloth

Cloth • 20 items in one auction • Item 2589 • Stored-override category S

1. Start with the saved per-item value

INPUT / RESULT	CHECKED AMOUNT
Stored override per item	89c (89 copper)
Rolled buyer value per item	71c-1s 2c
Stack count / template maximum	20 / 20
Ordinary budget for the whole stack	14s 20c-20s 40c
Positive vendor cap in the checked lookup	None

A low-value stack makes the arithmetic easy to see. The source label S does not add a separate multiplier; the saved override is the input.

2. Follow one example evaluation

Suppose the bot rolls **80c per item**. For 20 items, the budget is **80 × 20 = 1,600 copper (16s)**. At a **15s total buyout**, the price test passes because 15s is below 16s. The buyout payment would be **15s**, before fees—not the budget amount.

3. Compare possible asking prices

TOTAL STACK BUYOUT	MEANING	BUYOUT TEST ¹
14s 19c	One copper below the lowest stack budget	100%
14s 20c	Equal to the lowest stack budget	96.88%
17s 80c	Stored centre × stack count	40.62%
20s 39c	One copper below the highest stack budget	3.12%
20s 40c	Equal to the highest stack budget	0%

To avoid rejection from the random budget: the highest whole-stack buyout that passes every checked roll is **14s 19c**. The highest buyout that can pass at all is **20s 39c**. Neither is a sale guarantee.

¹ Conditional on selection and other eligibility checks. There are 32 equally likely integer unit valuations; multiply each by 20. Percentages describe the buyout price test on one evaluation, not sale-before-expiry odds. A failed buyout test may still lead to a bid.

W — Thorium Headed Arrow

Ammunition • 1,000 arrows in one auction • Item 18042 • Stored-override category W

1. Start with the saved per-item value

INPUT / RESULT	CHECKED AMOUNT
Stored override per item	26c (26 copper)
Rolled buyer value per item	20c–29c
Stack count / template maximum	1,000 / 1,000
Ordinary budget for the whole stack	2g–2g 90s
Positive vendor cap in the checked lookup	None

Ammunition can use a much larger stack. The same one-roll rule applies: there are only ten possible unit rolls here, not a smooth range of every copper amount in the stack budget.

2. Follow one example evaluation

Suppose the bot rolls **27c per item**. For 1,000 items, the budget is **27 × 1,000 = 27,000 copper (2g 70s)**. At a **2g 60s total buyout**, the price test passes because 2g 60s is below 2g 70s. The buyout payment would be **2g 60s**, before fees—not the budget amount.

3. Compare possible asking prices

TOTAL STACK BUYOUT	MEANING	BUYOUT TEST ¹
1g 99s 99c	One copper below the lowest stack budget	100%
2g	Equal to the lowest stack budget	90.00%
2g 60s	Stored centre × stack count	30.00%
2g 89s 99c	One copper below the highest stack budget	10.00%
2g 90s	Equal to the highest stack budget	0%

To avoid rejection from the random budget: the highest whole-stack buyout that passes every checked roll is **1g 99s 99c**. The highest buyout that can pass at all is **2g 89s 99c**. Neither is a sale guarantee.

¹ Conditional on selection and other eligibility checks. There are 10 equally likely integer unit valuations; multiply each by 1,000. Percentages describe the buyout price test on one evaluation, not sale-before-expiry odds. A failed buyout test may still lead to a bid.

P — Primal Water

Elemental crafting material • 20 items in one auction • Item 21885 • Stored-override category P

1. Start with the saved per-item value

INPUT / RESULT	CHECKED AMOUNT
Stored override per item	23g 17s 8c (231,708 copper)
Rolled buyer value per item	18g 53s 66c-26g 64s 64c
Stack count / template maximum	20 / 20
Ordinary budget for the whole stack	370g 73s 20c-532g 92s 80c
Positive vendor cap in the checked lookup	None

P identifies how the saved price was estimated. The bot uses this explicit override and its configured variation; it does not apply the underlying formula again or add another quality/category multiplier.

2. Follow one example evaluation

Suppose the bot rolls **24g per item**. For 20 items, the budget is **240,000 × 20 = 4,800,000 copper (480g)**. At a **460g total buyout**, the price test passes because 460g is below 480g. The buyout payment would be **460g**, before fees—not the budget amount.

3. Compare possible asking prices

TOTAL STACK BUYOUT	MEANING	BUYOUT TEST ¹
370g 73s 19c	One copper below the lowest stack budget	100%
370g 73s 20c	Equal to the lowest stack budget	99.9988%
463g 41s 60c	Stored centre × stack count	42.86%
532g 92s 79c	One copper below the highest stack budget	0.0012%
532g 92s 80c	Equal to the highest stack budget	0%

To avoid rejection from the random budget: the highest whole-stack buyout that passes every checked roll is **370g 73s 19c**. The highest buyout that can pass at all is **532g 92s 79c**. Neither is a sale guarantee.

¹ Conditional on selection and other eligibility checks. There are 81,099 equally likely integer unit valuations; multiply each by 20. Percentages describe the buyout price test on one evaluation, not sale-before-expiry odds. A failed buyout test may still lead to a bid.

A — Heavy Borean Leather

Leather crafting material • 20 items in one auction • Item 38425 • Stored-override category A

1. Start with the saved per-item value

INPUT / RESULT	CHECKED AMOUNT
Stored override per item	4g 69s 55c (46,955 copper)
Rolled buyer value per item	3g 75s 64c-5g 39s 98c
Stack count / template maximum	20 / 20
Ordinary budget for the whole stack	75g 12s 80c-107g 99s 60c
Positive vendor cap in the checked lookup	None

A marks an adjusted override. The ordinary valuation still scales with stack count. This is a buying-decision example—not advice to buy vendor stock for resale or a statement that resale would be profitable.

2. Follow one example evaluation

Suppose the bot rolls **4g 80s per item**. For 20 items, the budget is **48,000 × 20 = 960,000 copper (96g)**. At a **94g total buyout**, the price test passes because 94g is below 96g. The buyout payment would be **94g**, before fees—not the budget amount.

3. Compare possible asking prices

TOTAL STACK BUYOUT	MEANING	BUYOUT TEST ¹
75g 12s 79c	One copper below the lowest stack budget	100%
75g 12s 80c	Equal to the lowest stack budget	99.99%
93g 91s	Stored centre × stack count	42.85%
107g 99s 59c	One copper below the highest stack budget	0.0061%
107g 99s 60c	Equal to the highest stack budget	0%

To avoid rejection from the random budget: the highest whole-stack buyout that passes every checked roll is **75g 12s 79c**. The highest buyout that can pass at all is **107g 99s 59c**. Neither is a sale guarantee.

¹ Conditional on selection and other eligibility checks. There are 16,435 equally likely integer unit valuations; multiply each by 20. Percentages describe the buyout price test on one evaluation, not sale-before-expiry odds. A failed buyout test may still lead to a bid.

The stack trap: a vendor cap

Runic Healing Potion • Item 33447 • S category • 20 potions in one auction

The surprising result: this checked buyer will not buy out a stack of 20 Runic Healing Potions above **60s for the entire auction**. The ordinary random budget is much larger, but the positive vendor guard cap is only 6,000 copper and is not multiplied by 20.

VALUE	AMOUNT
Stored override per potion	2g 45s
Ordinary rolled value per potion	1g 96s–2g 81s 75c
Ordinary budget for 20 potions	39g 20s–56g 35s
Positive cap: 1 potion / 5 potions / 20 potions	60s / 60s / 60s per auction
Highest allowed buyout for this stack	60s total (average 3s per potion)

Why a 12g stack does not work

It is tempting to multiply 60s by 20 and post the stack for **12g**. The ordinary budget test passes, even at its lowest roll of **39g 20s**. But the vendor guard then compares the **12g whole-auction buyout** with **60s** and cancels that buyout.

TOTAL BUYOUT	ORDINARY BUDGET TEST	VENDOR GUARD / RESULT
60s	Passes every checked roll.	Equality with the cap is allowed; buyout passes.
60s 1c	Passes every checked roll.	Above the cap; buyout blocked.
12g	Passes every checked roll.	Above the cap; buyout blocked.

Two different equality rules

Budget: buyout must be strictly below the rolled stack budget. **Cap:** buyout may equal the positive cap. To pass every valuation, the maximum is **min(lowest stack budget – 1 copper, positive cap)**. To pass any valuation, use the highest stack budget instead.

No fallback after a selected buyout is blocked: a 12g buyout with a 50s starting bid still gets no bid from that evaluation when the ordinary test selects the buyout and the cap cancels it. The code does not return to the bid branch afterward.

This cap is the module's vendor guard lookup based on the item's SellPrice, not an NPC's retail BuyPrice. Trade Goods (class 7) are excluded from that lookup; zero SellPrice bypasses the positive-cap check. Vendor availability and a positive buyer cap are therefore not interchangeable.

Practical warning: 60s is a code threshold, not a recommendation to sell 20 potions that cheaply. Compare the stack's total vendor-sale value, acquisition cost, fees and player demand before posting. No optional vendor patch was applied.

More stacks: crafting materials

Eight additional item types • Every buyout below is for the full stated stack

Use the stack count shown—not a per-unit listing price

All examples on this page have **no positive vendor cap** in the checked lookup. “Every roll” means the highest buyout that avoids random-budget rejection. “Any roll” means the highest buyout that can pass at all; only the top unit roll permits that price. Neither means a guaranteed purchase.

ITEM / TYPE / STACK	ORDINARY STACK BUDGET	MAX BUYOUT: EVERY ROLL	MAX BUYOUT: ANY ROLL
Copper Ore Ore • S ID 2770 • ×20	4g-5g 75s	3g 99s 99c	5g 74s 99c
Copper Bar Metal bar • S ID 2840 • ×20	12g 2s 40c-17g 28s 40c	12g 2s 39c	17g 28s 39c
Rough Stone Stone • S ID 2835 • ×20	39s 20c-56s 20c	39s 19c	56s 19c
Silverleaf Herb • S ID 765 • ×20	22s-31s 60c	21s 99c	31s 59c
Strange Dust Enchanting dust • S ID 10940 • ×20	4g-5g 75s	3g 99s 99c	5g 74s 99c
Lesser Moonstone Gem • S ID 1705 • ×20	3g 36s-4g 83s	3g 35s 99c	4g 82s 99c
Mote of Shadow Elemental mote • S ID 22577 • ×10	88s-1g 26s 50c	87s 99c	1g 26s 49c
Light Leather Basic leather • S ID 2318 • ×20	80s-1g 15s	79s 99c	1g 14s 99c

Example: a stack of 20 Silverleaf

The unit roll is **1s 10c-1s 58c**, so the stack budget is **22s-31s 60c**. A **21s 99c** total buyout passes every price roll. At **31s 59c**, only the 1s 58c unit roll passes. Do not enter 21s 99c as a per-item price: that would post the stack for 4g 39s 80c.

S = inherited scrape-derived override; W = imported/calibrated override; P = saved formula estimate; A = adjusted override. These are price-source labels, not additional multipliers or item classes. All values are gross and based on the checked configuration.

More stacks: usable and crafted items

Eight additional examples • Same rules, different item types and pricing labels

Use the stack count shown—not a per-unit listing price

All examples on this page have **no positive vendor cap** in the checked lookup. “Every roll” means the highest buyout that avoids random-budget rejection. “Any roll” means the highest buyout that can pass at all; only the top unit roll permits that price. Neither means a guaranteed purchase.

ITEM / TYPE / STACK	ORDINARY STACK BUDGET	MAX BUYOUT: EVERY ROLL	MAX BUYOUT: ANY ROLL
Charred Wolf Meat Cooked food • W ID 2679 • ×20	1s 20c–1s 80c	1s 19c	1s 79c
Catseye Elixir Elixir • S ID 10592 • ×20	36s–51s 60c	35s 99c	51s 59c
Lesser Flask of Resistance Flask • S ID 44939 • ×20	42g–60g 37s 40c	41g 99s 99c	60g 37s 39c
Crazy Alchemist's Potion Uncapped potion • S ID 40077 • ×20	59g 84s–86g 2s	59g 83s 99c	86g 1s 99c
Heavy Dynamite Engineering explosive • A ID 4378 • ×20	1g 94s 40c–2g 79s 60c	1g 94s 39c	2g 79s 59c
Enchanted Vial Crafting vial • A ID 40411 • ×20	13g 91s–19g 99s 60c	13g 90s 99c	19g 99s 59c
Glyph of the Bear Cub Glyph • P ID 43362 • ×20	64s–92s	63s 99c	91s 99c
Raw Slitherskin Mackerel Raw fish • P ID 6303 • ×20	8s 60c–12s 40c	8s 59c	12s 39c

Example: potions do not all share the same cap

Crazy Alchemist's Potion has no positive cap in the checked lookup, while **Runic Healing Potion** has the 60s whole-auction cap on p.6. Do not copy a cap or a valuation from one potion to another. Check the exact item ID.

S = inherited scrape-derived override; W = imported/calibrated override; P = saved formula estimate; A = adjusted override. These are price-source labels, not additional multipliers or item classes. All values are gross and based on the checked configuration.

Before you post the stack

Exact copper, intentional bids and the remaining purchase checks

One copper below the stack budget—not below every unit

LINEN COUNT	LOWEST STACK BUDGET	MAX BUYOUT PASSING EVERY ROLL
1	71c	70c
5	3s 55c	3s 54c
20	14s 20c	14s 19c

At 20 items, multiplying the one-item 70c threshold gives **14s**, which also passes—but **14s 19c** is the exact whole-stack maximum across every roll. If your addon accepts only whole-copper per-item prices, 70c each produces 14s total. Always inspect the final **total auction buyout**.

How to calculate a stack's price-test percentage

For the uncapped stored overrides here, let **L** and **H** be the unit-roll endpoints, **N** the count and **B** the total buyout in copper. The smallest passing unit roll is **floor(B ÷ N) + 1**. Count the integers from **max(L, floor(B ÷ N) + 1)** through **H**; if none remain, the chance is zero. Divide that count by **H - L + 1**. A positive cap exceeded by **B** makes the buyout result zero regardless of the ordinary budget.

For 20 Linen Cloth at a **15s total buyout**, the unit roll must be at least 76c. Rolls 76–102 pass: **27 of 32 = 84.375%**. This is conditional on a selected, otherwise eligible auction—not an expiry-time sales forecast.

Final checklist

CHECK	WHAT MATTERS
Config and buyer	Confirm the checked override is actually loaded, variations are enabled, buyer modifier is 1.0, buyer is enabled and valid bot GUIDs replace the GUIDs=0 placeholder.
Count, item and house	Confirm the item ID, legal stack size, tradability, correct auction house and total price. The auction must still exist and be selected for evaluation.
Owner / current bidder	Configured bot-owned auctions and auctions whose current bidder is a configured bot are excluded by the candidate query. No price guarantees random selection.
Starting and current bids	An initial bid may equal the budget; an existing bid plus the required increment must be strictly below it. A positive cap also limits the selected bid. Set a starting bid you are willing to accept.
Payment and net proceeds	The bot pays the accepted buyout or selected bid, not its rolled budget. Auction fees reduce proceeds; returned deposit principal is not profit. Check addon per-unit versus per-stack entry modes.

Verification and scope

Checked 21 item templates, 137,962 unit valuations through the extracted pricing function, 715,538 extracted buyer/guard decisions and 108 probability rows, plus six branch-boundary tests. Config/source match the previous Rakzur guide; module baseline NathanHandley f685832994c8 and core/world 166853431101. Supporting CSVs record exact copper. No source/config changes, live-server tests or addon certification were performed.
