

Selling to the Bot — A Player's Guide

AH Bot Plus · corrected edition · current mod_ahbot.conf.txt · 9 September 2026

The short version. Use the actual server pricing rules, not the cheapest visible auction, to assess a bot sale. A compatible addon can help scan and post, but **undercutting does not guarantee a purchase**. Check the item ID, eligibility, whole-auction cap and starting bid; then compare possible net proceeds with vendoring and your acquisition cost.

Part one — the basics

Why an undercut can still fail

A seller listing is an asking price. Its random valuation is not the buyer's next roll, and the cheapest visible listing is only the minimum of the auctions you can see—not proof of the mathematical floor. The buyer does not use your addon's market average or undercut percentage as its budget.

Your config enables 12,906 explicit overrides. These use approximately **0.80-1.15× the stored amount**, with integer/float handling. Other items use the runtime formula, which can include multipliers, clamping and rerolls. A single percentage rule does not describe every fallback value.

W = freshly calculated acceptable value per item
n = item count; B = whole-auction buyout
Buyout price tests: $B > 0$ and $B < W * n$
For a positive guarded ID, also require $B \leq S$
S = the cap for the WHOLE auction, not each unit

Which price-list value to use — Iron Riveted War Helm (45107)

READ THIS VALUE	AMOUNT / ACTION
Lower end of "Buyout range / unit"	4,000g 64s 40c
One-item buyout: subtract 1 copper	4,000g 64s 39c

You can set the **starting bid to the same amount** to avoid accepting a lower initial bid. Do **not** use Centre / ref., the starting-bid range or Bot max / 1 as the minimum-budget target. This helm has no positive vendor cap in the checked lookup. The suggested buyout passes the ordinary price test across the checked valuations, but **selection and the other checks still apply**; it is not a sale-before-expiry guarantee.

Still required: the item must be normally auctionable, the buyer must be active, and your eligible auction must be selected in the correct house with valid auction/item data. **Remaining-checks checklist:** page 9.

Probability describes a price test—not delivery time

Illustration only: an uncapped single item with an equally likely integer buyer budget from **8,000 to 11,500 copper inclusive**. Assuming it is selected and all other checks pass, the ordinary buyout-test probability is:

BUYOUT (COPPER)	BUDGET TEST PASSES	INTERPRETATION
7,999	100.00%	Below every budget in this illustration
8,000	99.97%	Equality fails on the lowest draw
10,000	42.84%	Some draws permit it
11,499	0.03%	Only the highest draw permits it
11,500	0.00%	No draw passes the buyout test

For this illustration: passing draws = $\max(0, H - \max(L, B + 1) + 1)$; divide by $H - L + 1$. This is not a universal fallback distribution or a probability of selling before expiry. Integer endpoints matter; a buyout exactly equal to the budget fails.

No fixed waiting-time promise. Even a price below every computed budget can remain unsold because the auction was not selected, the buyer was inactive, the item was invalid or another check prevented the transaction.

Selection, timing and the vendor guard

How fast will it sell?

CURRENT SETTING	VALUE	WHAT IT ACTUALLY CONTROLS
MinutesBetweenBuyCycle	5:20	Random interval counters between buyer actions; manual updates affect counter progress.
BuyCandidatesPerBuyCycle	1:3	Random candidate attempts per applicable buyer-house invocation, not completed purchases.
AcceptablePriceModifier	1.0	Multiplier applied to the buyer's calculated unit value.
AlwaysBidMaxCalculatedPrice	false	An accepted initial bid uses your starting bid, not automatically the maximum budget.
BidAgainstPlayers	true	Existing non-bot bids may be considered under the increment and budget rules.

The candidate query excludes bot-owned auctions and auctions whose current bidder is a configured bot. It draws from a shared pool, but each house invocation resolves auctions in that house. A pick can be wasted on another house or invalid data. Candidates are not a personal queue for your character.

Pool size, house distribution, repeated selections, successful purchases and auctions that leave the pool change the outcome. A single remaining candidate cannot consume three distinct picks in one invocation. Cross-faction auctions use the neutral pass and a merged house; **one pass does not imply one-third of the effective purchase rate.**

There is no general "9.6 examinations an hour," "five stacks sell in half an hour," or fixed time to inspect every listing. Those figures require assumptions that do not hold for every pool. The module does not reserve a purchase slot for your next auction.

Quality is not a safety rating

The complete positive-cap inventory contains **2,467 IDs**, not just the 1,326 override-priced IDs. Of these, **1,333** have no identified static binding/duration block; **1,134** are bound and/or timed and normally cannot be auctioned. These are guard records, not counts of live listings or guaranteed tradable items.

QUALITY	POSITIVE CAPS	MEANING
Poor / grey	15	Includes normally tradable and/or blocked templates; check the ID.
Normal / white	1,575	Not every white item is covered.
Uncommon / green	214	Green is not exempt from the guard.
Rare / blue	373	Blue is not automatically safe.
Epic / purple	270	Purple is not automatically safe.
Heirloom	20	Retained for coverage; do not assume auction eligibility.

Coverage is the unmodified direct npc_vendor join, excluding class 7 (Trade Goods), with positive SellPrice. Zero SellPrice bypasses this check; event-only or otherwise missing lookup entries do not acquire a positive cap merely because an NPC can sell them. An absent cap is not proof of profit or buyer acceptance.

Use **AHBot_Do_Not_Sell_List.pdf** for exact IDs and flags. Seller blacklisting is separate: it stops generated seller supply, not the buyer's valuation of a player-owned item.

Part two — stacks

How the seller chooses a stack

GetStackSizeForItem first rolls whether to use the stack branch. If it does, it draws an increment count and clamps the result to the template's maximum. All configured MaxStackSize values are 0, meaning no additional config maximum. These settings govern **bot-generated listings**, not the stack size a player must choose.

CLASS	STACK-BRANCH CHANCE	INCREMENT	POSSIBLE SIZE EXAMPLE
TradeGood	75%	5	1, 5, 10, 15, 20 (20-max example)
Consumable	50%	5	1, 5, 10, 15, 20 (20-max example)
Gem	30%	1	1-20 (20-max example)
Projectile	100%	1,000	1000 (1,000-max)
Misc	100%	1	1-20 (20-max example)
Generic	100%	1	1-20 (20-max example)
Reagent	50%	1	1-20 (20-max example)
Quest	10%	1	1-20 (20-max example)
Key	10%	1	1-20 (20-max example)
Weapon	0%	1	1 (20-max example)
Armor	0%	1	1 (20-max example)
Recipe	0%	1	1 (20-max example)
Container	0%	1	1 (20-max example)
Quiver	0%	1	1 (20-max example)
Glyph	0%	1	1 (20-max example)

"Stack-branch chance" is not necessarily the chance of more than one item: an increment of 1 can still draw a single. Template limits may be 1, 5, 10, 20, 1,000 or another value; the examples above are not claims about every item in each class.

Singles still occur. Greater Cosmic Essence has max stack 10 and a trade-goods increment of 5: possible seller sizes are **1, 5 and 10**, not just 5 and 10. A trade good with max stack 3 can be **1 or 3**. The non-stack branch is still available.

One price roll is multiplied by the stack count

```
CalculateItemValue(template, unitBid, unitBuyout);  
count = GetStackSizeForItem(template);  
auction.startbid = unitBid * count;  
auction.buyout = unitBuyout * count;
```

There is no built-in bulk discount in that multiplication. Each listing uses one unit-price roll for all its units; separate listings can roll different prices. Seller stack preference does not make a player stack more acceptable to the buyer.

Some grey items can stack. For example, Broken Fang (7073) has max stack 5 in the checked database. The seller's poor-quality exclusion does not change what a player-owned template can stack to.

Stack budgets, deposits and net receipts

What the buyer checks on your stack

The ordinary budget is the freshly calculated unit value times your actual count. On an uncapped item, compare the **whole buyout** with that budget. A covered item must also pass the separate whole-auction vendor cap. Neither the cheapest visible single nor a seller's chosen stack size determines the result.

Correct unit comparison. At the same auction total, a stack of 20 costs **one quarter as much per item** as a stack of 5—not four times as much. Always check whether your addon field accepts a unit price or the whole-stack total.

Worked — Saronite Ore (36912)

COUNT	CALCULATED SELLER TOTAL	ONE COPPER BELOW LOWEST STACK BUDGET
1	45s 60c – 65s 55c	45s 59c
5	2g 28s – 3g 27s 75c	2g 27s 99c
10	4g 56s – 6g 55s 50c	4g 55s 99c
15	6g 84s – 9g 83s 25c	6g 83s 99c
20	9g 12s – 13g 11s	9g 11s 99c

The exact unit range is **45s 60c–65s 55c**. For 20 ore, a buyout of 9g 11s 99c is below the 9g 12s lowest ordinary stack budget. An addon using 45s 59c per item would post 9g 11s 80c instead—also lower, but not the same amount. Neither price is a sale guarantee.

Deposits are not always identical across packaging

Assumptions for these examples: standard faction 12-hour deposit calculation (depositPercent=5), deposit rate=1, and the core's 100c minimum per auction. Your live settings may differ. The deposit is returned on a successful sale; ordinary unsold expiry loses it.

100 UNITS LISTED AS	AUCTIONS	SARONITE ORE: TOTAL DEPOSIT	LINEN CLOTH: TOTAL DEPOSIT
100 × 1	100	3g 75s	1g
20 × 5	20	3g 75s	20s
10 × 10	10	3g 75s	10s
5 × 20	5	3g 75s	5s

Saronite Ore has SellPrice 25s per unit; Linen Cloth has SellPrice 13c. Minimum deposits make Linen Cloth packaging matter substantially. Exact float/integer rounding can also produce small differences; do not assume all deposits are mathematically identical.

Successful receipts versus profit

Tables here use a **5% auction cut, rate=1**, with the pinned core's truncation. A 52c sale nets 50c; a 5c sale nets 5c because the cut rounds to zero. Neutral-house or custom cuts can differ. Returned deposit principal is not earnings. Subtract acquisition costs and lost deposits when judging profit.

Part three — worked items, without safety labels

Read these tables as calculations, not purchase promises

All examples on pages 5–6 have explicit stored overrides. A † marks zero seller listing weight; other sample rows pass the checked seller stages. Their ranges are **not observed listings**. Category/quality/advanced formula multipliers are not reapplied to these overrides. A quality label describes the template; it does not measure market demand or guarantee a sale.

Uncommon weapons — one item per auction

ITEM / ID	COUNT	CALCULATED BUYOUT RANGE ¹	PRICE BELOW BUDGET FLOOR ²	NET IF SOLD ³
Fracturing Battleaxe (36594)	1	103g 41s 78c – 148g 66s 31c	103g 41s 77c	98g 24s 69c
Amani Tomahawk (25209)	1	34g 6s 3c – 48g 96s 17c	34g 6s 2c	32g 35s 72c
Hawkeye Bow (15296)	1	14g 97s 26c – 21g 52s 31c	14g 97s 25c	14g 22s 39c
Goblin Screwdriver (1936)	1	2g 67s 36c – 3g 84s 33c	2g 67s 35c	2g 53s 99c
Rodentia Flint Axe (2281)	1	3s 60c – 5s 17c	3s 59c	3s 42c

¹ Calculated totals, not observed listings. ² One copper below the lowest ordinary stack budget, or the positive guard cap if lower. ³ Successful-sale receipts after the assumed 5% cut, excluding returned deposit principal and acquisition costs. † Zero seller listing weight. No row guarantees selection or a purchase.

Fracturing Battleaxe can have random suffixes. The module prices its base template, not the generated suffix stats; real-player demand can differ between variants. Unbound condition and ordinary player-auction eligibility still matter.

Normal items — full template stacks

ITEM / ID	COUNT	CALCULATED BUYOUT RANGE ¹	PRICE BELOW BUDGET FLOOR ²	NET IF SOLD ³
Linen Cloth (2589)	20	14s 20c – 20s 40c	14s 19c	13s 49c
Frostweave Cloth (33470)	20	3g 80s – 5g 46s 20c	3g 79s 99c	3g 61s
Saronite Ore (36912)	20	9g 12s – 13g 11s	9g 11s 99c	8g 66s 40c
Infinite Dust (34054)	20	45g 60s – 65g 55s	45g 59s 99c	43g 32s
Runic Healing Potion (33447)	20	39g 20s – 56g 35s	60s CAP	57s

¹ Calculated totals, not observed listings. ² One copper below the lowest ordinary stack budget, or the positive guard cap if lower. ³ Successful-sale receipts after the assumed 5% cut, excluding returned deposit principal and acquisition costs. † Zero seller listing weight. No row guarantees selection or a purchase.

Runic Healing Potion is not exempt because it is white or stackable. Its unit valuation is 1g 96s–2g 81s 75c, but the guard caps the whole auction at **60s**. The CAP row is hypothetical permitted pricing, not a recommended way to turn 20 potions into one potion’s vendor value.

No blanket grey-item formula

The seller rejects poor-quality items, but that alone is not a buyer ban. A grey item without an override may receive runtime valuation, including class floors, curves and vendor-floor handling. Guard membership, item level, SellPrice and tradability still matter. There is no universal “under 8 silver is profitable” rule, and grey items are not universally unstackable.

More rarities — the same buyer checks

Uncommon, rare, epic and legendary examples

ITEM / ID	COUNT	CALCULATED BUYOUT RANGE ¹	PRICE BELOW BUDGET FLOOR ²	NET IF SOLD ³
Eternal Fire (36860)	20	464g – 667g	463g 99s 99c	440g 80s
Titanium Ore (36910)	20	100g 69s 80c – 144g 75s 40c	100g 69s 79c	95g 66s 31c
Greater Cosmic Essence (34055)	10	39g 52s – 56g 81s	39g 51s 99c	37g 54s 40c
Primordial Saronite (49908)	20	6,357g 39s 80c – 9,138g 76s	6,357g 39s 79c	6,039g 52s 80c
Frozen Orb (43102)	20	444g – 638g 25s	443g 99s 99c	421g 80s
Arctic Fur (44128)	20	944g – 1,357g	943g 99s 99c	896g 80s
Saronite Razorheads (41165) †	1000	5g 90s – 8g 50s	5g 89s 99c	5g 60s 50c
Abyss Crystal (34057)	20	624g – 897g	623g 99s 99c	592g 80s
Cardinal Ruby (36919)	20	1,144g – 1,644g 50s	5g CAP	4g 75s
Iceblade Arrow (52021)	1000	6g 10s – 8g 80s	6g 9s 99c	5g 79s 50c
Elementium Bar (17771)	20	5,328g – 7,659g	5,327g 99s 99c	5,061g 59s 99c

¹ Calculated totals, not observed listings. ² One copper below the lowest ordinary stack budget, or the positive guard cap if lower. ³ Successful-sale receipts after the assumed 5% cut, excluding returned deposit principal and acquisition costs. † Zero seller listing weight. No row guarantees selection or a purchase.

What these rows establish—and what they do not

Saronite Razorheads (41165): † marks zero seller weight, so its calculated range does not imply generated bot stock. **Trade goods:** class 7 is outside this particular vendor lookup. That exemption does not remove the ordinary price test, selection rules, costs or other restrictions. “Best gold per examination” and “highest-value stack in the game” require a broader comparison than this sample.

Elementium Bar (17771): the checked template is quality 5 (Legendary), class 7 and max stack 20. This confirms that row’s data, not a claim that it is the only stackable legendary in every version of WoW. Its stored override is varied directly; the configured legendary formula multiplier is not reapplied.

Cardinal Ruby: a positive cap of 5g applies to the whole auction. Its large calculated seller range does not become a similarly large buyer allowance. See the next page for the exact comparison.

Artifact rows are not a live catalogue. The seven artifact entries in the main price list have zero seller listing weight in this config. Stone of Backus (6724), for example, is valued but is not evidence the bot normally generates that listing. A stored price is not a promise of seller supply or normal player availability.

Part four — the whole-auction cap

Two budgets with different stack behavior

```
ordinaryBudget = unitBuyerValue * count;  
// For an item with a positive lookup cap S:  
if (selectedBuyout > S) rejectBuyout;  
if (selectedBid > S) rejectBid;  
// S is NOT multiplied by count.
```

SellPrice means the NPC's buy-back value, not the price the NPC charges you. The ordinary budget must permit the action too. Equality with the cap is allowed, but equality with the ordinary budget does not pass the buyout test.

Worked — Cardinal Ruby (36919)

AUCTION / ALTERNATIVE	TOTAL	PRICE-TEST RESULT	NET IF SOLD ¹
1 gem at stored centre	71g 50s	Fails the 5g cap	—
1 gem at the cap	5g	Passes these price tests; selection still required	4g 75s
20 gems at 5g each	100g	Fails the whole-auction cap	—
20 gems, whole auction 5g	5g	Passes these price tests; severely below stack vendor value	4g 75s
Vendor all 20 gems	100g	NPC payout, no auction cut	100g

¹ Assumed standard 5% cut, rate=1. A lower positive buyout can also pass; exactly 5g is not the only permitted price. No “passes” row guarantees a transaction. The full-stack calculated seller range is 1,144g–1,644g 50s.

Worked — Runic Healing Potion (33447)

AUCTION / ALTERNATIVE	TOTAL	RESULT / RECEIPTS
20 potions at 1g 95s 99c each	39g 19s 80c	Fails the 60s cap
20 potions, total at cap	60s	If sold: 57s total, not 57s per potion
1 potion at cap	60s	If sold: 57s
Vendor all 20 potions	12g	12g immediate NPC payout

Usually prefer vendoring for a bot-targeted capped sale. For an ordinary unbound, undamaged covered item, capped gross payment cannot exceed one unit's NPC value. The auction cut may reduce it; a tiny cut can round to zero. A stack faces the same single-unit cap while its NPC payout grows with count.

When auctioning can still make sense

A real player can pay more than this bot's cap. If targeting players, check actual demand, eligibility, fees and relisting risk. The cap is a bot restriction, not a prohibition on player-to-player sales. Bound/timed B/T entries in the complete cap inventory normally cannot be auctioned and have no actionable payment recommendation.

Part five — bids, buyouts and lockout

Set the starting bid to an amount you would accept

With `AlwaysBidMaxCalculatedPrice=false`, the buyer uses your starting bid if it reaches the initial-bid branch and the price tests pass. An unaffordable buyout paired with a very low start bid can therefore produce a sale at that low bid. A buyout of zero permits bidding only, not immediate buyout.

```
if (buyout > 0 && buyout < ordinaryBudget)
    choose buyout;
else if (no current bid && startbid <= ordinaryBudget)
    choose startbid;
else if (currentBid > 0 &&
        currentBid + requiredIncrement < ordinaryBudget)
    choose that incremented bid;
// Apply the positive vendor cap AFTER choosing the branch.
```

The rejected-buyout trap

Knitted Sandals (792): a 1g buyout is below its 4g 96s 92c lowest unit budget, so the code selects buyout. The guard then rejects it because the whole-auction cap is 41c. Even if the start bid is 41c, the code **does not return to try that bid during this evaluation**. Lowering the start bid is not a workaround for an over-cap selected buyout.

A bot bid changes future candidate eligibility

```
WHERE itemowner NOT IN (configured bot GUIDs)
    AND buyguid NOT IN (configured bot GUIDs)
```

While a configured bot remains the current bidder, this query excludes the auction from further buyer consideration. It is not a permanent lockout in every circumstance: if a real player outbids the bot, the current bidder changes, and this config's `BidAgainstPlayers=true` can allow later consideration again. A real player can also buy out the auction.

If the bot stays the highest bidder until expiry and normal completion succeeds, proceeds are based on that winning bid, minus the cut, with the deposit returned—not on your unsatisfied buyout. This is why the starting bid is an acceptance price, not a harmless placeholder.

Opening bid = buyout can be a useful choice, not a guarantee. Where normal posting rules permit it, setting both to a price you accept avoids a lower initial bid. An ordinary-budget equality may permit bidding rather than immediate buyout. Selection, caps, increments and validity checks still apply.

Buying from the seller bot

The buyer excludes auctions owned by configured bots, so it does not bid on those listings. Other real players or other modules can still compete with you. An uncontested valid bid normally wins at expiry; it is not an unconditional promise for every live server.

For override-priced seller listings with enabled bid variation, the initial bid is approximately 75–95% of the drawn buyout. That is roughly a 5–25% initial discount, averaging near 15% under the isolated uniform-draw assumption. Competition, rounding and final bids change your actual saving. Seller durations are configured from 12 to 48 hours; auction completion and mail settings also matter.

Remaining checks and practical addon use

After setting the correct price, what else must happen?

For Iron Riveted War Helm at **4,000g 64s 39c**, the checked one-item minimum-budget test is satisfied and there is no positive cap in the lookup. The following conditions still matter. These are checks and prerequisites—not extra prices you must undercut.

CHECK / PREREQUISITE	WHAT IT MEANS FOR YOUR AUCTION
1. Normal auction eligibility	Your item instance must be accepted by the core for auction posting: it must be tradable, not soulbound, and free of blocking duration/conjured or other restrictions. A template price alone does not make an item auctionable.
2. A working, active buyer	The module needs valid configured bot characters, Buyer.Enabled=true and an applicable buyer action. The distributed config has GUIDs=0 until an administrator supplies real bot character GUIDs. A low price cannot activate a disabled or unconfigured buyer.
3. Candidate eligibility	The auction owner must not be a configured bot, and its current bidder must not be one either. This config allows consideration of non-bot player bids; a later config with BidAgainstPlayers=false would exclude auctions with an existing bid.
4. Random selection and house match	The buyer must select your auction during a due buyer action. Its house-specific pass must be able to resolve the selected auction. Listing cheaply does not give it priority in the random selection.
5. Auction and item still exist	The selected auction must still be present in the relevant house, with a valid item object, a positive item count and a valid item template. An auction removed by cancellation, completion or expiry is no longer available for this purchase.
6. Current price and branch tests	The posted whole-auction buyout must be positive and strictly below the freshly calculated stack budget, and at most any positive cap. Bidding uses different boundaries and increments. A selected buyout rejected by the cap does not fall back to a bid; see page 8.

For your helm: if these prerequisites hold, the auction is selected, the checked config/data remain unchanged and the normal transaction succeeds, the buyer code chooses buyout at **4,000g 64s 39c**. There is no additional market-demand score or addon approval test. The uncertainty is not a hidden higher discount you must offer.

What is not an extra purchase-price test

Seller blacklisting, seller quality filters and seller listing weights do not themselves ban the buyer from purchasing your auction. The inspected buyer routine also does not check or debit a normal player-wallet balance. Auction cuts and deposit rules affect costs or receipts, not this buyer's budget calculation.

Sale versus receiving the money: normal auction/database processing and seller-mail delivery must complete. Server mail-delay settings can delay receipt after a purchase. Custom scripts or live-server faults can affect completion; lowering the price does not fix them.

What auction addons can and cannot do

A compatible 3.3.5 addon can scan auctions, show unit/stack prices, assist posting and track your own sales. Those functions still work. Market averages, external price feeds and undercuts do not communicate a binding offer from the bot.

An ordinary scan does not reveal the server's full config, exact cap membership or its next random draw. A custom addon with exported item-ID caps and current pricing rules can calculate bounds and reject known-invalid totals, but cannot promise selection, live eligibility or purchase timing. No specific addon version was compatibility-tested for this guide.

Do not multiply discounts twice. "80% of the configured override" and "80% of the cheapest visible auction" are not the same rule. If using a verified floor, derive it from the current pricing data—not another percentage reduction of an observed listing.

The detailed addon explanation is also in AHBot_Do_Not_Sell_List.pdf, pages 51–52. Its cap inventory and this guide use the same current config and unpatched module baseline.

Cheat sheet

WHAT YOU ARE SELLING	HOW TO APPROACH IT	WHY
Trade goods	Choose a valid stack size; check the calculated whole-stack budget and acquisition cost.	Class 7 bypasses this particular cap lookup, not all checks. No best-profit or fixed sale-time guarantee.
Ammunition	Check item ID, cap and template stack limit.	Projectile seller settings do not force player listings or certify a profitable 1,000-stack sale.
Potions, food, gems and other stackables	Check the whole-auction cap before applying a unit-price rule.	A high unit valuation cannot override a small total cap.
Green, blue and purple gear	Check the exact ID, binding state and budget; list only if normally tradable.	Colour is not a safety classification. Seller pricing uses the base template, not rolled suffix demand.
Positive-cap items	Compare net receipts with immediate vendoring; target real players only when justified.	The bot cap applies once per auction. Tiny fee cuts may be zero; player bids are not capped by this rule.
Grey, artifact or unusual entries	Do not infer availability or profit from a stored valuation.	Seller filtering/zero weight and player tradability are different questions. Some grey items stack.

The posting workflow

#	CHECK
1	Decide whether you are targeting the bot or real players. Use a compatible addon for convenience, not as proof of bot acceptance.
2	Check the exact item ID and live tradability. For any quality, consult AHBot_Do_Not_Sell_List.pdf for positive caps and eligibility flags.
3	Use the current item-price data: overrides versus runtime formula, integer bounds, and gross allowance versus net receipts.
4	Check the whole-auction total. For an uncapped item, a positive total below the lowest budget passes that price test across the checked valuations—not every other test.
5	Set a starting bid you accept, and a buyout if you want the buyout option. Understand the rejected-buyout branch and the current-bidder exclusion.
6	Choose stack size and duration based on value, deposit exposure, likely buyers and your tolerance for unsold inventory. Inspect actual outcomes rather than assuming a fixed waiting time.

Scope, sources and verification

This is a corrected player guide, not a live-server sale guarantee. Checked against the uploaded current config (12,906 stored overrides), unchanged AuctionHouseBot.cpp and the pinned AzerothCore world/core baseline. No vendor-guard patch, source edits or config changes were applied. The buyer routine directly updates auctions/mail; it does not enforce a normal player-wallet balance check.

Source functions: `CalculateItemValue`; `GetStackSizeForItem`; `AddNewAuctions`; `AddNewAuctionBuyerBotBid`; `PopulateVendorItemsPrices`; `Update`. Core fee/deposit reference: `AuctionHouseMgr.cpp` and `CalculatePct` in `Util.h`. Item fields and guard membership use the checked database snapshot, not a certification of vendor access or custom scripts. Core/world revision: 16685343110115b12e76d517f7bac15c6a97fb2a. Module source/config match repository revision a0461ba2362f86cfdff35b01b29e3f9f063c2538.

All worked prices retain copper precision and use the rechecked price data. Fee tables assume a standard faction 5% cut and rate=1; deposit examples explicitly assume the standard faction 12-hour calculation and rate=1. Live neutral/cross-faction/custom rates, item condition and server changes can alter results. Supporting calculation CSV and validation notes accompany this edition.
